Materials and experimental design

Onion (60 days): 134-38-99 kg/ha NPK + 20 t/ha manure

Broadcast

5 top-dressed split applications

Mini-plot size: 0.6 m x 1.2 m

^{15}N -Urea: 10.16% ab

Amendments (achieve 2.5% of clay content):

**-Factor 1: clay soil (300 t/ha) ,
bentonite (100 t/ha) and
sugarcane residue (SR) (30 t/ha)**

- Factor 2: irrigation (flood and sprinkler)

Sprinkler: 16 L/m²/day

Flood: 19 L/m²/day

Findings

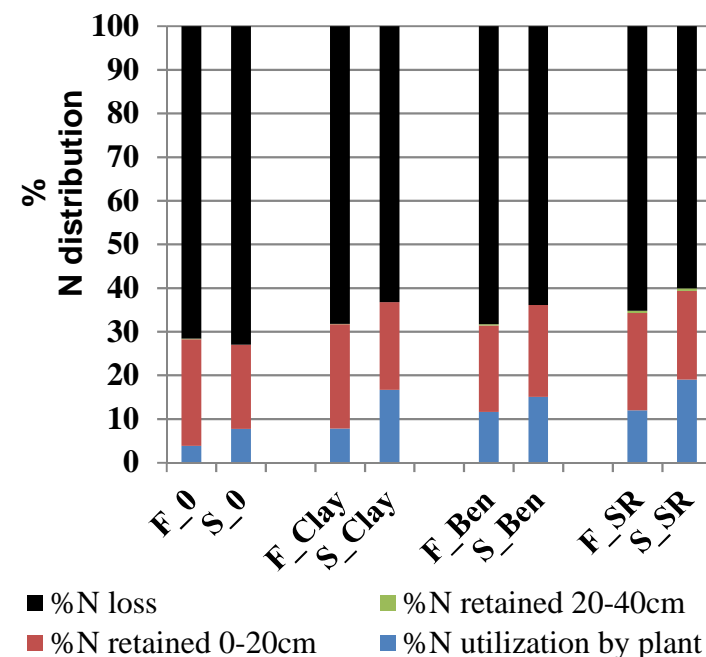

Dry matter yield and N uptake from onion crop , March-May 2015

Amend- ment	Irrigation	Dry matter yield	N uptake	N uptake from fertilizer
		kg/ha	kg/ha	kg/ha
0	F	558 d	11.6 d	5.2 e
Clay	F	940 d	20.8 d	10.4 de
Ben	F	1705 bc	33.9 bc	15.6 cd
SR	F	1506 c	32.1 c	16.1 bcd
0	S	980 d	21.0 d	10.4 de
Clay	S	2134 b	43.8 ab	22.4 ab
Ben	S	1879 bc	38.6 bc	20.1 abc
SR	S	2769 a	51.2 a	25.5 a
LSD _{0.05}		498	10.7	6.0

Ben: bentonite; clay; Clay: clay-rich soil; SR: sugarcane residue

Irrigation: F: flood; S: sprinkler;

- The amendment of sands with clay-rich soil, bentonite or sugarcane residue reduced N loss and increased both soil N retention and plant N utilization.
- Sprinkler irrigation on the sand increased fertilizer N use efficiency.
- The fertilizer N use efficiency even with the best combination of amendment and sprinkler irrigation was very low, and 63 – 73 % of fertilizer N was lost from the plant-soil system.

Nitrogen distribution in soil-onion system
